I have been working diligently on improving the whole TinyStats experience. The reports have evolved significantly, I have made architectural changes on the back end, I have registered a domain, etc.

I have been experimenting with various methods to communicate back to the central server, one of which is using the ever popular embedded image. My method is special, though, because inside the img tag I refer to a PHP script instead of a standard image file. The user's browser does not know the difference and merely waits for the image to load. The PHP script records the visitor's information, then serves up an image. It works great. I will post more at a later date...too much to do tonight...

I am also very excited about the future home of TinyStats: MyTinyStats.com. I am slowly moving pieces over to the new domain, cleaning things up a bit as I go. I will be treating the TinyStat report pages hosted on CookingWithSQL to be a testing/development area. When I am happy with the results of a modification, I will migrate that to MyTinyStats.com.

I hope to announce a general public beta before Christmas of this year. Stay tuned!
